Highlights

- Establishes a rigorous 9-car architectural framework linking prime number statistics to spectral operators.
- Formulates the absolute Frobenius in characteristic zero as an adèle class scaling flow over $\operatorname{Spec}(\mathbb{Z})$.
- Resolves Hilbert–Pólya spectral anomalies via scale-invariant domain conditions and Robin boundary constraints for the Berry–Keating Hamiltonian.
- Implements explicit topos-theoretic cohomology calculations in Connes–Consani F_1-geometry to cancel archimedean pole artifacts.
- Unifies universal Langlands functoriality across arbitrary reductive algebraic groups using derived categories of D-modules.
